

**Dengue Virus Type 2, 328298**

**Catalog No. NR-12217**

**For research use only. Not for human use.**

**Contributor:**

Rebeca Rico-Hesse, Ph.D., MPH, Department of Virology and Immunology, Southwest Foundation for Biomedical Research, San Antonio, Texas

**Manufacturer:**

NIH Biodefense and Emerging Infections Research Resources Repository, NIAID, NIH

**Product Description:**

Virus Classification: *Flavivirus, Flaviviridae*

Species: Dengue virus type 2

Strain/Isolate: 328298

Original Source: Dengue virus type 2 (DEN-2), 328298 was isolated in 1995 in Reynosa, Mexico along the Texas-Mexico border region.<sup>1</sup>

Dengue virus causes the most common vector-borne viral disease of humans, with over 50 million cases in tropical and subtropical regions each year.<sup>2</sup> The disease is now endemic in over 110 countries in the world, with Southeast Asia and the Western Pacific being the most seriously affected. Dengue disease is caused by one of four closely related, but antigenically distinct, serotypes (designated DEN-1 to -4).<sup>2</sup> Infections produce a spectrum of clinical illness ranging from a nonspecific viral syndrome to severe and fatal hemorrhagic disease.<sup>3,4</sup> Humans are the major host of dengue virus, with *Aedes aegypti* mosquitoes the principal vectors.

**Material Provided:**

Each vial contains approximately 1 mL of cell lysate and supernatant from *Aedes albopictus* clone C6/36 cells (ATCC® CRL-1660™) infected with DEN-2, 328298.

Note: If homogeneity is required for your intended use, please purify prior to initiating work.

**Packaging/Storage:**

NR-12217 was packaged aseptically in screw-capped plastic cryovials. The product is provided frozen and should be stored at -70°C or colder immediately upon arrival. For long-term storage, the vapor phase of a liquid nitrogen freezer is recommended. Freeze-thaw cycles should be avoided.

**Growth Conditions:**

Host: *Aedes albopictus* clone C6/36 cells (ATCC® CRL-1660™)

Growth Medium: Minimum Essential Medium with Earle's salts supplemented with 2% irradiated fetal bovine serum,

2 mM L-glutamine and 1 mM sodium pyruvate  
Infection: Cells should be 80% to 90% confluent (not 100% confluent)

Incubation: 7 to 10 days at 28°C and 5% CO<sub>2</sub>

Cytopathic Effect: Cell rounding

**Biosafety Level: 2**

Appropriate safety procedures should always be used with this material. Laboratory safety is discussed in the following publication: U.S. Department of Health and Human Services, Public Health Service, Centers for Disease Control and Prevention, and National Institutes of Health. Biosafety in Microbiological and Biomedical Laboratories. 5th ed. Washington, DC: U.S. Government Printing Office, 2007; see [www.cdc.gov/od/ohs/biosfty/bmb15/bmb15toc.htm](http://www.cdc.gov/od/ohs/biosfty/bmb15/bmb15toc.htm).

**Disclaimers:**

You are authorized to use this product for research use only. It is not intended for human use.

Use of this product is subject to the terms and conditions of the BEI Resources Material Transfer Agreement (MTA). The MTA is available on our Web site at [www.beiresources.org](http://www.beiresources.org).

While BEI Resources uses reasonable efforts to include accurate and up-to-date information on this product sheet, neither ATCC® nor the U.S. Government make any warranties or representations as to its accuracy.
