

Product Information Sheet for NR-3470

Kilbourne F27:

**A/turkey/Kansas/4880/1980 (HA, NA) x
A/Puerto Rico/8/1934 (H1N1), H negative**

Catalog No. NR-3470

Derived from NIAID Catalog No. V-331-0E4151

For research use only. Not for human use.

Contributor:

National Institute of Allergy and Infectious Diseases (NIAID),
National Institutes of Health (NIH)

Manufacturer:

BEI Resources

Product Description:

Virus Classification: *Orthomyxoviridae, Influenzavirus A*

Species: Influenza A virus

Reassortant: A/turkey/Kansas/4880/1980 (HA, NA) x
A/Puerto Rico/8/1934 (H1N1), H negative (Kilbourne
F27)¹⁻³

Parents: A/turkey/Kansas/4880/1980 (H1N1), H negative,
and X-31 (H3N2)

Comments: The donor of the hemagglutinin and neuraminidase genes of NR-3470 is a derivative of influenza A virus, A/turkey/Kansas/4880/1980 (H1N1) (Kilbourne F26; BEI Resources NR-3473), which is a virus of swine antigenic phenotype isolated from a turkey in the course of a natural epizootic.^{4,5,6} As was the case with human isolates of swine phenotype, low- (L) and high-yield (H) HA mutants could be isolated from the wild type parent with the use of selective antibody. The parental virus used in the generation of NR-3470 was isolated from a turkey challenge¹ and is non-reactive with monoclonal antibody that specifically recognizes the H type HA.^{1,7} X-31 (Kilbourne F108; BEI Resources NR-3483) is A/Aichi/2/1968 (HA, NA) x A/Puerto Rico/8/1934 (H3N2),⁸ and has been shown to contain only the HA and NA genes from A/Aichi/2/1968 (H3N2). Since these were replaced by the HA and NA genes of the A/turkey/Kansas/4880/1980 (H1N1), H negative parent, NR-3470 does not contain any genes from A/Aichi/2/1968 (H3N2).

Material Provided:

Each vial contains approximately 1 mL of pooled allantoic fluid from specific pathogen free (SPF) embryonated chicken eggs infected with H negative reassortant influenza A virus, A/turkey/Kansas/4880/1980 (HA, NA) x A/Puerto Rico/8/1934 (H1N1).

Note: If homogeneity is required for your intended use, please purify prior to initiating work.

Packaging/Storage:

NR-3470 was packaged aseptically in screw-capped plastic cryovials. The product is provided frozen and should be stored at -60°C or colder immediately upon arrival. For long-term storage, the vapor phase of a liquid nitrogen freezer is recommended. Freeze-thaw cycles should be avoided.

Growth Conditions:

Host: 9- to 11-day-old SPF embryonated chicken eggs

Infection: Embryonated chicken eggs must be candled for viability prior to inoculation

Incubation: 2 days at 35°C in a humidified chamber

Effect: Hemagglutination activity using chicken red blood cells and allantoic fluid from infected embryonated chicken eggs

Citation:

Acknowledgment for publications should read "The following reagent was obtained through BEI Resources, NIAID, NIH: Kilbourne F27: A/turkey/Kansas/4880/1980 (HA, NA) x A/Puerto Rico/8/1934 (H1N1), H negative, NR-3470."

Biosafety Level: 2

Appropriate safety procedures should always be used with this material. Laboratory safety is discussed in the following publication: U.S. Department of Health and Human Services, Public Health Service, Centers for Disease Control and Prevention, and National Institutes of Health. Biosafety in Microbiological and Biomedical Laboratories. 5th ed. Washington, DC: U.S. Government Printing Office, 2009; see www.cdc.gov/biosafety/publications/bmbl5/index.htm.

Disclaimers:

You are authorized to use this product for research use only. It is not intended for human use.

Use of this product is subject to the terms and conditions of the BEI Resources Material Transfer Agreement (MTA). The MTA is available on our Web site at www.beiresources.org.

While BEI Resources uses reasonable efforts to include accurate and up-to-date information on this product sheet, neither ATCC® nor the U.S. Government makes any warranties or representations as to its accuracy.
