²10- to 11-day-old SPF embryonated chicken eggs acquired from Charles River, Norwich, Connecticut, USA

³The Chicken Embryo Infectious Dose 50% (CEID₅₀) is the dilution of virus that under the conditions of the assay can be expected to infect 50% of the inoculated embryonated chicken eggs, just as a Lethal Dose 50% (LD₅₀) is expected to kill half of the animals exposed. A reciprocal of the dilution required to yield the CEID₅₀ provides a measure of the infectious titer (or infectivity) of a virus preparation.

⁴Infected SPF embryonated chicken eggs were incubated for 2 days at 35°C in a humidified chamber.
