

Certificate of Analysis for HM-702

Lactobacillus iners, Strain Lactin V 09 (V1)-c

Catalog No. HM-702

Product Description: Lactobacillus iners (L. iners), strain Lactin V 09 (V1)-c was isolated from a

human vagina.

Lot^{1,2}: 61881801 Manufacturing Date: 30JUL2013

TEST	SPECIFICATIONS	RESULTS
Phenotypic Analysis		
Cellular morphology	Gram-positive rods	Gram-positive rods
Colony morphology ^{3,4}	Report results	Circular, slightly peaked, undulate, smooth and gray (Figure 1)
Motility (wet mount)	Report results	Non-motile
Genotypic Analysis		
Sequencing of 16S ribosomal RNA gene (~ 1510 base pairs)	≥ 99% identical to GenBank: AEHO01000002 [<i>L. iners</i> , strain Lactin V 09 (V1)-c]	≥ 99% identical to GenBank: AEHO01000002 [<i>L. iners</i> , strain Lactin V 09 (V1)-c]
Viability (post-freeze) ³	Growth	Growth

Quality control of HMP material is only performed to demonstrate that the material distributed by BEI Resources is identical to the deposited material. It should not be considered a complete characterization of the deposited organism.

²L. iners, strain Lactin V 09 (V1)-c was deposited by Sharon L. Hillier, Department of Obstetrics, Gynecology and Reproductive Sciences, Magee-Womens Research Institute, University of Pittsburgh, Pennsylvania. HM-702 was produced by inoculation of the deposited material into Lactobacilli MRS broth and incubated for 72 hours at 37°C in an anaerobic atmosphere (90% N₂:5% CO₂:5% H₂). Broth inoculum was added to Tryptic Soy agar with 5% defibrinated sheep blood kolles, and grown for 48 hours at 37°C in an anaerobic atmosphere to produce this lot. Purity of this lot was assessed for 7 days under propagation conditions.

³72 hours at 37°C in an anaerobic atmosphere on Tryptic Soy agar with 5% defibrinated sheep blood

⁴Colonies were observed under anaerobic and aerobic with 5% CO₂ atmospheric conditions when HM-702 was grown on Tryptic Soy agar with 5% defibrinated sheep blood for 72 hours. The 16S gene of each colony type was sequenced, the sequence of both colonies were identical and were consistent with L. iners. L. iners is a facultative anaerobe and the presence of growth in an aerobic atmosphere with 5% CO2 is not unexpected.
