**Enterococcus faecalis**, Strain B3119

**Catalog No. NR-31884**

For research use only. Not for human use.

**Contributor:**
Michael S. Gilmore, Sir William Osler Professor of Ophthalmology, Department of Ophthalmology, Massachusetts Eye and Ear Infirmary, Boston, Massachusetts, USA

**Manufacturer:**
BEI Resources

**Product Description:**

**Bacteria Classification:** Enterococcaceae, Enterococcus

**Species:** Enterococcus faecalis

**Strain:** B3119 (also referred to as EnGen0209)

**Original Source:** Enterococcus faecalis (E. faecalis), strain B3119 was isolated in the USA from human blood in 1987 by Mark Huycke.

**Comments:** E. faecalis, strain B3119 was deposited as a hemolytic, cytolytic isolate with resistance to gentamicin. The complete genome of E. faecalis, strain B3119 has been sequenced (GenBank: AIRF0000000).

E. faecalis is a Gram-positive, facultatively anaerobic coccus that is a commensal inhabitant of the gastrointestinal and female genital tract. It is also the most frequently isolated species, often as a monoinfection, from root canals of endodontically treated teeth with persistent apical periodontitis. E. faecalis is an opportunistic pathogen and has become a serious concern in hospitals because of its inherent hardness and high levels of antibiotic resistance. Virulent strains often express a cytolsin toxin that is encoded on various mobile genetic elements, pathogenicity islands, and conjugative plasmids.

**Material Provided:**

Each vial contains approximately 0.5 mL of bacterial culture in Tryptic Soy broth supplemented with 10% glycerol.

**Note:** If homogeneity is required for your intended use, please purify prior to initiating work.

**Packaging/Storage:**

NR-31884 was packaged aseptically, in screw-capped plastic cryovials. The product is provided frozen and should be stored at -60°C or colder immediately upon arrival. For long-term storage, the vapor phase of a liquid nitrogen freezer is recommended. Freeze-thaw cycles should be avoided.

**Incubation:**

Temperature: 37°C

Atmosphere: Aerobic

**Propagation:**

1. Keep vial frozen until ready for use, then thaw.
2. Transfer the entire thawed aliquot into a single tube of broth.
3. Use several drops of the suspension to inoculate an agar slant and/or plate.
4. Incubate the tube, slant and/or plate for 1 day.

**Citation:**

Acknowledgment for publications should read "The following reagent was obtained through BEI Resources, NIAID, NIH: Enterococcus faecalis, Strain B3119, NR-31884."

**Biosafety Level:**

2

**Disclaimers:**
