Catalog No. NR-28614

Influenza A Virus, A/duck/Czechoslovakia/1956 (H4N6) (uncloned)

For research use only. Not for use in humans.

Contributor: Earl G. Brown, Ph.D., Department of Biochemistry, Microbiology and Immunology, University of Ottawa, Ottawa, Ontario, Canada

Manufacturer: BEI Resources

Product Description:

Virus Classification: Orthomyxoviridae, Influenzavirus A
Species: Influenza A virus
Strain: A/duck/Czechoslovakia/1956 (H4N6), also A/duck/Czech Republic/1956 (H4N6) and A/duck/Czech Republic/1/1956 (H4N6)
Original Source: Influenza A virus, A/duck/Czechoslovakia/1956 (H4N6) was isolated from a duck in Košice, in what is now Slovakia, in 1956.1,2 Comments: Sequence information is available for influenza A virus, A/duck/Czech Republic/1/1956 (H4N6) at the Influenza Research Database. Note that although NR-28614 was deposited to BEI Resources as A/duck/Czechoslovakia/1956 (H4N6), nucleotide sequence obtained from the same source material by the NIAID Influenza Genome Sequencing Consortium was deposited to NCBI and IRD as A/duck/Czech Republic/1/1956 (H4N6). Comparison of several published nucleotide sequences indicates that the two strain designations can be considered synonymous. Moreover, a review of the literature suggests that this virus is ultimately derived from the Czechoslovak duck influenza virus first described by Koppel, et al., and originally known as A/Anatis/Košice/1956.1,2 Košice is located in eastern Slovakia, not in the Czech Republic.

Material Provided:

Each vial contains approximately 1 mL of pooled allantoic fluid from specific pathogen free (SPF) embryonated chicken eggs infected with influenza A virus, A/duck/Czech Republic/1/1956 (H4N6).

Note: If homogeneity is required for your intended use, please purify prior to initiating work.

Packaging/Storage:

NR-28614 was packaged aseptically in screw-capped plastic cryovials. The product is provided frozen and should be stored at -60°C or colder immediately upon arrival. For long-term storage, the vapor phase of a liquid nitrogen freezer is recommended. Freeze-thaw cycles should be avoided.

Growth Conditions:

Host: 9- to 11-day-old SPF embryonated chicken eggs
Infection: Embryonated chicken eggs must be candled to confirm viability prior to inoculation
Incubation: 3 days at 34°C in a humidified chamber without CO2
Effect: Hemagglutination activity using allantoic fluid from infected embryonated chicken eggs and chicken red blood cells

Citation:

Acknowledgment for publications should read “The following reagent was obtained through BEI Resources, NIAID, NIH: Influenza A Virus, A/duck/Czechoslovakia/1956 (H4N6) (uncloned), NR-28614.”

Biosafety Level: 3

Disclaimers:

You are authorized to use this product for research use only. It is not intended for human use.

Use of this product is subject to the terms and conditions of the BEI Resources Material Transfer Agreement (MTA). The MTA is available on our Web site at www.beiresources.org.
