

# **Product Information Sheet for NR-30536**

## Neisseria meningitidis, Strain 98008

# Catalog No. NR-30536

## For research use only. Not for use in humans.

Blythe, M.D., Assistant Director and State Epidemiologist, Maryland Department of Health and Mental Hygiene, Baltimore, Maryland, USA; David Barroso, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil; Samir Saha, Department of Microbiology, Bangladesh Institute of Child Health, Dhaka Shishu Hospital, Dhaka, Bangladesh; and Leonard Mayer, Chief, Meningitis Laboratory, Centers for Disease Control and Prevention, Atlanta, Georgia, USA

### Manufacturer:

**BEI Resources** 

## **Product Description:**

Bacteria Classification: Neisseriaceae, Neisseria

Species: Neisseria meningitidis

Strain: 98008 Serogroup: 29E<sup>1</sup>

Original Source: Neisseria meningitidis (N. meningitidis), strain 98008 was isolated in 1998 from a human disease

case in France.1

<u>Comments</u>: *N. meningitidis*, strain 98008 was deposited as member of serogroup 29E. The complete genome of *N. meningitidis*, strain 98008 was sequenced at the Genomic Sequencing Center for Infectious Diseases at <u>University of Maryland School of Medicine</u> (GenBank: <u>ALXU000000000</u>).

N. meningitidis is an aerobic, Gram-negative diplococcus and is the leading causative agent of human bacterial meningitis.<sup>2</sup> This organism commonly exists asymptomatically as a commensal bacterium in the nasopharynx and is transmitted by aerosol or secretion.3 Humans are the only natural reservoir of N. meningitidis and distribution of the 13 serogroups is highly dependent on region. Occasional epidemics have been associated with encapsulated strains in serogroups A, B, C, W-135 and Y.3,4 N. meningitidis is able to escape host immunity by transformative and recombinant genetic variability, including capsule switching, which is believed to have contributed to global outbreaks of certain serogroups, raising efforts for vaccine development and disease surveillance.4,5,6 Polysaccharide vaccines are available for serogroups A, C, W-135 and Y but limited for serogroup B.3,4

#### **Material Provided:**

Each vial contains approximately 0.5 mL of bacterial culture in *Haemophilus* Test medium supplemented with 10% glycerol.

<u>Note</u>: If homogeneity is required for your intended use, please purify prior to initiating work.

## Packaging/Storage:

NR-30536 was packaged aseptically in cryovials. The product is provided frozen and should be stored at -60°C or colder immediately upon arrival. For long-term storage, the vapor phase of a liquid nitrogen freezer is recommended. Freeze-thaw cycles should be avoided.

#### **Growth Conditions:**

Media:

Haemophilus Test medium or equivalent

Chocolate agar or equivalent

Incubation:

Temperature: 37°C

Atmosphere: Aerobic with 5% CO<sub>2</sub>

Propagation:

- 1. Keep vial frozen until ready for use, then thaw.
- 2. Transfer the entire thawed aliquot into a single tube of broth.
- Use several drops of the suspension to inoculate an agar slant and/or plate.
- Incubate the tube, slant and/or plate at 37°C for 1 to 2 days.

#### Citation:

Acknowledgment for publications should read "The following reagent was obtained through BEI Resources, NIAID, NIH: *Neisseria meningitidis*, Strain 98008, NR-30536."

## Biosafety Level: 2

Appropriate safety procedures should always be used with this material. Laboratory safety is discussed in the following publication: U.S. Department of Health and Human Services, Public Health Service, Centers for Disease Control and Prevention, and National Institutes of Health. Biosafety in Microbiological and Biomedical Laboratories (BMBL). Current Edition. Washington, DC: U.S. Government Printing Office.

## Disclaimers:

You are authorized to use this product for research use only. It is not intended for human use.

Use of this product is subject to the terms and conditions of the BEI Resources Material Transfer Agreement (MTA). The MTA is available on our Web site at <a href="https://www.beiresources.org">www.beiresources.org</a>.
