¹*S. enterica* subsp. *enterica* serovar Typhimurium, strain A36 was deposited by Professor Michael McClelland of the Sidney Kimmel Cancer Center, San Diego, California. The bacterial preparation used for extraction of genomic DNA was produced by Tryptic Soy Broth culture of the deposited material. After incubation for 24 hours at 37°C and aerobic atmosphere, genomic DNA was extracted using proprietary technology.

²Also consistent with other *Salmonella* species

³The µg of DNA in the vials is greater than required by current specifications

⁴5 days at 37°C in an aerobic atmosphere

⁵An extraction procedure was used that has been shown to consistently inactivate 100% of Gram-negative bacteria.
