Staphylococcus aureus, Strain NY-12

Catalog No. NR-46234

Product Description: Staphylococcus aureus (S. aureus), strain NY-12 was isolated in 2005 from the blood of a 14-day-old male with cellulitis and/or a bloodstream infection in New York, USA. S. aureus, strain NY-12 is a clinically-associated methicillin-resistant S. aureus (MRSA) strain.

Certificate of Analysis for NR-46234

¹S. aureus, strain NY-12 was deposited to BEI Resources as part of the NARSA collection. NR-46234 was produced by inoculation of the deposited material into Tryptic Soy broth and grown 1 day at 37°C in an aerobic atmosphere. Broth inoculum was added to Tryptic Soy agar with 5% defibrinated sheep blood kolles which were grown 1 day at 37°C in an aerobic atmosphere to produce this lot.

²1 day at 37°C in an aerobic atmosphere on Tryptic Soy agar with 5% defibrinated sheep blood

³4 hours at 37°C in rabbit serum with 0.15% EDTA (Coagulase Plasma BBL™ 240827)

⁴Percent probabilities above 90% indicate a close match to the typical biochemical pattern for the given organism, with a percent probability of 99% being a perfect match between the test reaction pattern and the unique biochemical pattern of the given organism or organism group. For additional information, please refer to O'Hara, C.M. and J. M. Miller. Microbiol. 41 (2003): 2096-2101. PubMed: 12734254.

⁵Minimum Inhibitory Concentration (MIC); MIC Interpretation Guideline: CLSI M100-S22 (2012)

⁶The production of beta-lactamase was detected using a Cefinase™ Paper Disc (BBL™ 231650).

The VITEK® AST-GP71 card tests for both clindamycin resistance and inducible clindamycin resistance (ICR). A positive ICR test is indicative of inducible MLS₀ resistance, which confers resistance to macrolides, lincosamides, and type B streptogramin and the isolate should be considered resistant to clindamycin. *S. aureus*, strain NY-12 was found to be sensitive to clindamycin but had a positive ICR test and therefore is considered resistant to clindamycin.

⁸MIC Interpretation Guideline: EUCAST Version 4.0 (2014)

91 day at 37°C in an aerobic atmosphere on Mueller Hinton agar

¹⁰For both chloramphenicol (bioMérieux Etest[®] 412308) and teicoplanin (bioMérieux Etest[®] 412459), a MIC ≤ 8 μg/mL is sensitive, a MIC = 16 μg/mL is intermediate and a MIC ≥ 32 μg/mL is resistant.

¹¹S. aureus, strain NY-12 was deposited as susceptible to chloramphenicol. Antibiotic susceptibility testing performed in duplicate determined that strain NY-12 has an intermediate susceptibility to chloramphenicol.

¹²Purity of this lot was assessed for 7 days at 37°C in an aerobic atmosphere on Tryptic Soy agar with 5% defibrinated sheep blood.
