${ }^{1}$ Aedes albopictus clone C6/36 cells (ATCC ${ }^{\circledR}$ CRL-1660 ${ }^{\text {TM }}$ )
${ }^{2}$ Grown in Eagle's Minimum Essential Medium containing Earle's Balanced Salt Solution, non-essential amino acids, 2 mM L-glutamine, 1 mM sodium pyruvate and $1.5 \mathrm{~g} / \mathrm{L}$ of sodium bicarbonate (ATCC ${ }^{\circledR} 30-2003$ ) supplemented with $2 \%$ fetal bovine serum (ATCC ${ }^{\circledR} 30-2020$ ) for 7 days at $28^{\circ} \mathrm{C}$ with $5 \% \mathrm{CO}_{2}$.
${ }^{3}$ Using Anti-Dengue Virus Type 3 Antibody (Millipore MAB8703)
${ }^{4}$ The Tissue Culture Infectious Dose $50 \%\left(\mathrm{TCID}_{50}\right)$ endpoint is the $50 \%$ infectious endpoint in cell culture. The $\mathrm{TCID}_{50}$ is the dilution of virus that under the conditions of the assay can be expected to infect $50 \%$ of the culture vessels inoculated, just as a Lethal Dose $50 \%\left(\mathrm{LD}_{50}\right)$ is expected to kill half of the animals exposed. A reciprocal of the dilution required to yield the $\mathrm{TCID}_{50}$ provides a measure of the titer (or infectivity) of a virus preparation.
${ }^{5}$ Assay plates were incubated 14 days at $28^{\circ} \mathrm{C}$ and $5 \% \mathrm{CO}_{2}$
